

Experiment in advance short-term earthquake prediction using algorithm *Reverse Tracing of Precursors ("RTP")*

Prediction #7, January 29, 2005

An earthquake with magnitude $M \geq 6.4$ (as reported in the *ANSS* composite catalog) is predicted to occur before August 16, 2005 (00:00 GMT) in the gray area shown in the figure below.

Estimated probability that a target earthquake will occur at random in the time-area of alarm is less than 1%. Estimated probability of a false alarm does not exceed 50%.

Red circles show the earthquakes that formed precursory chain. They are numbered in the order of occurrence, as in their catalog given below. Area of alarm is shown in gray.
