

# Experiment in prospective earthquake prediction using Reverse Tracing of Precursors (RTP)

## Prediction #28(NP), April 15, 2012

Red circles show the earthquakes that formed precursory chain on March, 13, 2012. Area of alarm is shown by red contours: solid line test A, dashed line test B.

Starting from October 1, 2005 we test in parallel two versions of the prediction algorithm. Test A concerns exactly the same algorithm as before. In test B we made one change: we increased by factor 2.5 the value of the numerical parameter,  $R$ , thus expanding the area of alarm.

An earthquake with magnitude  $M_w \geq 7.2$  is predicted to occur during the period March 13 to December 13, 2012. Area of alarm is shown in the figure.

Estimated probability that a target earthquake will occur at random in the total time-area of the alarm is less than 3% in both tests A and B.

Probability of a false alarm estimated by the method does not exceed 50% in both tests.

**Reminder.** As you know, earthquake predictions should be released to the public or media only by a proper disaster management authority. Otherwise, prediction may trigger profiteering and disruptive anxiety of population. Accordingly, we open an access to our predictions only to professionals who agreed to comply with the above limitations. This restriction is lifted and prediction becomes publicly available when a target earthquake occurs in the area of alarm, or when the alarm expires, independently of was it correct or wrong
